

"We have a bit of a leeway in [exploring 'comic book science,'" co-writer and artist Francis Manapul told CNN in a recent interview. "What's been really fun is finding real world scientific facts and pushing the ideas. When you read science journals where they're theorizing, we're able to ask, 'what if that wasn't just a theory, but it was real?' With Barry [Allen, the Flash's alter ego] being a scientist himself, there's lots of ways we can explore that." "This may not be [scientifically] possible for us to do, but the Flash can do it. Readers [today] are more science savvy. They need that little wedge of cheese to bring them along, to let them know it's based on science. We're putting steroids on science and we're pumping it up," he added. There's much more to be found over at the site, so be sure to click on the link below
