

The app is based on an actual intelligence test done at Kyoto University (<http://news.nationalgeographic.com/news/2007/12/071203-AP-chimp-memory.html>), and parallels the central storyline of the new studio's upcoming film "Rise of the Planet of the Apes," in which a scientist's tampering with the laws of nature leads to the development of superior intelligence in apes and the onset of a war for supremacy. The test is as simple as it is revealing: the numbers 1-9 appear on the screen in random positions, and then are quickly covered. You must remember their positions, and then touch the squares in numeric order, in order to pass to the next round. A number is added for each round, so after several rounds recreating their proper positions becomes quite a challenge – for humans, that is. Studies show that young chimps outperform adult humans in this memory test. "We were very surprised to find this," Tetsuro Matsuzawa of
